

**TABLE 7: Learning across landmarks and services**

<b>Community resilience: Our approach to monitoring and learning is ...</b>	<b>How to do it</b>
<b>Risk-informed</b>	We base the process on an initial risk assessment carried out by the community. We encourage the community to consider new risks or information needs that emerge after the assessment.
<b>Holistic</b>	We use the dimensions of community resilience. We encourage the community to consider changes in and outside the community that may have contributed to successes or failures.
<b>Demand-driven</b>	We enable the community to understand the purpose of monitoring and ensure resilience actions are driven solely by the community's needs and priorities.
<b>People-centred and inclusive</b>	We ensure that community members' perspectives and monitoring (rather than external actors or data sources) drive and inform the process. We encourage and facilitate the participation of all sectors of the community, supporting social inclusion in the longer term.
<b>Climate smart and environmentally sustainable</b>	We ensure that community actions and learning take into account past, current and future risk, including the increasing frequency and severity of extreme weather events, temperature rise and other longer-term impacts of climate change.
<b>Accompanying</b>	We introduce the idea and offer continuous encouragement.
<b>Enabling</b>	We build capacity, facilitate, and pass on experience. We include NS MEAL teams in key exchanges and learn from their efforts.
<b>Connecting</b>	We encourage stakeholders to participate. We disseminate the results outside the community. We build support.
